

What's New in Bark24 | Dyn version 1.1.0

Version 1.1.0 brings improved stability and user-requested feature enhancements.

For all features, refer to the User Manual: https://fskaudio.io/downloads/Bark24Dyn_User_Manual.pdf

New Features table of contents:

- [Frequency Band Multi-Selection](#)
- [Auto Gain](#)
- [Auto Output](#)
- [Output Limiter](#)
- [Miscellaneous improvements](#)

Frequency Band Multi-Selection

Multiple frequency bands can be selected so that they can be adjusted as a group.

Selecting and deselecting multiple bands

- Click on a frequency label to toggle between selected and unselected.
 - Selected bands will display a white line under the frequency label.
- Swipe across frequency labels to toggle multiple bands at once.
- Option/Alt-click on a frequency label to toggle all bands.
- Drag the group control  left/right to shift the multi-selection left/right.

Parameters on multi-selected bands are adjusted as a group.

- Sliders (Threshold & Gain)
 - Moving one slider will move all others in the multi-selection. Relative offsets are retained.
 - Shift-drag up/down to temporarily disable the multi-selection behavior.
 - Shift-swipe left/right to draw a curve with the multi-selected sliders.
 - Option/Alt-click a slider to reset all sliders in the multi-selection.
- Buttons (Solos/Mutes/Power)
 - Clicking one button will set all other in the multi-selection to the same state.
 - Shift-click a button to temporarily disable the multi-selection behavior.
 - Option/Alt-click a button to toggle all buttons, regardless of multi-selection.

Auto Gain

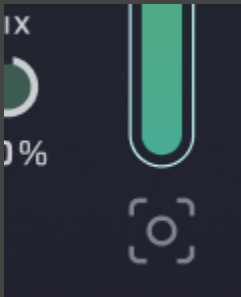

While enabled, Bark24 | Dyn will automatically adjust the band gains based on the gain change applied by the Dyn processing.

This minimizes per-band level change, helping to better hear the process itself.

⚠ Auto Gain is NOT available for Gate mode as it would result in extreme gain changes.

Option(Mac)/Alt(Win)-click to toggle Auto Threshold, Auto Gain, and Auto Output at the same time.

Auto Output

While enabled, Bark24 | Dyn will automatically adjust the Output fader so that the output signal level matches the input signal level.

Option/Alt-click to toggle Auto Threshold, Auto Gain, and Auto Output at the same time.

Output Limiter

A brickwall limiter that engages when the signal exceeds +12dB has been implemented to protect your ears and equipment from accidental signal spikes.

Miscellaneous improvements

Band Selection/Solos/Mutes/Power states can be shifted left/right

- Group handles  become available when a row has both enabled and disabled buttons.
- Drag a group handle left/right to reposition all settings on that row.

Auto Threshold remains enabled when Dyn mode is changed

In version 1.0 Auto Threshold was disabled when the Dyn mode was changed. In version 1.1 it will remain enabled allowing for faster comparisons..

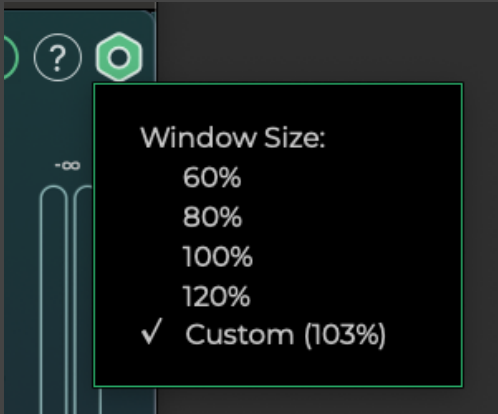

Option/Alt-click to toggle all three Auto buttons.

Hold down Option (Mac) or Alt (Win) and click on any Auto button to toggle all three at once for quickly getting a good starting point.

The three Auto buttons are:

- Auto Threshold
- Auto Gain
- Auto Output

Preferences Menu displays the current zoom level

Zoom sizes other than the preset percentages are displayed in the Preference menu.
